

# Start with one...increase to many.

Introducing the all new EV charging system from matt:e.

A unique solution which manages charging, load management, electrical safety and cyber security to an unprecedented level.

Caring about your World

## The Hub

The Hub is the brains of the charging system and is designed to be installed near to the electrical supply/distribution board.

Keeping the brains inside ensures, unlike other smart chargers currently available on the market, that the expensive commodity susceptible to vandalism, damage, theft and increasing cyber security attacks is safely inside under lock and key.

All charge points are cyber security activated and controlled through a VPN (Virtual Private Network) ensuring high levels of security against cyber attack.

The Hub can dynamically control up to 200 charge points making future expansion of the system a simple and extremely cost effective solution.

The Hub will dynamically balance the power given to each of the charge points, ensuring the safety and integrity of the building's electricity supply.

Additionally The Hub can detect excess electricity being generated from Solar PV, wind turbines, etc and utilise this generated power exclusively if required.
